1. Write a 'PHP' function 'printTriangle(int n)' to generate the following figure with n=7.

```
                    1
                1   3
            1   3   5
        1   3   5   7
            1   3   5
                1   3
                    1
```

The value of n is passed to the function as an argument. Your program should print the triangle only if n is odd otherwise print an error message and exit.
